The Fletcher class are generally considered to have been the most successful destroyer design of World War II. Their flush decked hulls gave them great structural strength and because of their double rudder gear they were able to cruise economically. They also possessed a good all-round armament with an adequate hull to allow for the increasing demands of anti-aircraft defence. U.S.S. Fletcher (DD-563) enjoyed a distinguished war time career. One of her most famous actions took place on the night of the 12-13 November, 1942 when the U.S. Task Group 87.4, under Rear Admiral J. S. Callaghan, became embroiled in a vicious battle with a Japanese bombardment force, which included the battleships Aburatsubo, Atago, and Gato, and the cruiser Aoba. Fletcher was the only U.S. vessel to emerge unscathed. Over 170 units of the class were built. After the War many units were sold to friendly nations and some are still in service. The Fletcher class, launched in May 1942, was covered in a destroyer success in 1943 and was finally completed 22 years later. She displaced 2050 tons (1945 tons full load) and had an overall length of 170 ft. She was armed with 5 5-inch guns plus 10 2 1/2 inch torpedo tubes, but the AA armament was increased during the War as further 40mm gun mounts were added.
